

BUSINESS AVIATION SECURITY

A NEVER ENDING END-TO-END ISSUE

Business Aviation has to guarantee discretion and protection at all levels. Security is an end-to-end issue: Only very tight and seamless security can protect passengers, goods and Business Aircraft. And best practices help ensure the best possible security both at and away from home base in cooperation with the authorities on location and the customers security delegates. Of course

pilots and all other all crew and support staff undergo a complete security clearance process.

Security personnel have to protect travelers and aircraft through the entire operations. Security Vulnerability Assessments have to be conducted for many types of business aviation operations: Airport Security Programs, Security Assessments for FBO's operators - general aviation, aircraft terminals and hangar facilities, Security Directives Compliance, Contractors and Staff screening and background checks.
